OSASION BRAND POSITIONING

OSASION BRAND POSITIONING

1. Project Core Parameters

1.1 Brief Description Of Osasion

Full Name Of The Project: Osasion derivative financial control distributed interactive ecological digital economy

Project Chinese Name: 欧赛

Project English Name: Osasion

Meaning Of The Name: Through the innovation of the industry and top-level architecture design, through the positioning of the blockchain industry Oscar (Oscar), it pays attention to the osmosis (penetration) and asset (asset) security of its ecological attributes, thus deriving the name of this project.

Brand Positioning: Establish a distributed financial ecosystem on the decentralized asset consensus chain

Market Statement: Asset Consensus Public Chain

Property: Decentralized Finance

Public Chain As a Whole Plus Blockchain Browser Title: Osasion

Blockchain Mainnet: Osasion mainnet

Public Chain Ecological Application Layer: Bayesian Ecology

Public Chain Main Network: Pilot Network (Public Test Network) + Official Main Network

Public Beta Network (Pilot Test Network): Phase 0 (Atlantis)

Official Website: Troy

1.2 Dual Token System

Token: UORA (奥拉) stable currency against USD

Initial Circulation: 1 billion

Nature: Maintain the fluidity and interaction requirements of the network

Token: AUC (Osasion) mainnet value coin

Total AUC Mining Pool: 137436181 pieces

Nature: asset consensus target, high value-added asset anchor

2. Brand Positioning

2.1 Brand Positioning: Establish a Distributed Financial Ecosystem On The Decentralized Consensus Asset Chain

2.2 Project Overview:The Osasion public chain is committed to building a distributed financial ecosystem on the decentralized asset consensus chain. The first MPOS consensus mechanism will create a distributed decentralized financial empowerment network that is jointly built and shared by the main body of consensus. Financial innovation will enhance the fairness and scalability of the crypto asset world.

2.3 Market Statement: Asset Consensus Public Chain

2.4 Property: Decentralized Finance

3. Osasion

3.1 What Is Osasion

3.1.1 Brand Positioning: Establish a Distributed Financial Ecosystem On The Decentralized Consensus Asset Chain

3.1.2 Market statement: asset consensus public chain

3.1.3 Property: Decentralized Finance

3.1.4 Talk About The Project In One Sentence:Osasion public chain is committed to building a distributed financial ecosystem on the decentralized asset consensus chain.The first MPOS consensus mechanism will create a distributed and decentralized financial empowerment network that is jointly built and shared by the main body of consensus. Financial innovation at the protocol layer will promote the fairness and scalability of the encrypted asset world.Osasion integrates consensus to build assets. Through a new ecological digital economy of distributed governance, it fits the core concept of decentralized finance and is committed to building an asset consensus public chain that benefits tens of millions of consensus nodes.

Osasion public chain created the world’ s first MPOS (Multiple consensus impower single sign-on Proof of stake), and established a completely decentralized distributed node autonomous system through 25 million nodes.The joint construction of the overall public chain nodes allows everyone to participate and reward fairness and justice.The design of the node puts users in the network, and Osasion's nodes will no longer be users but participants in the main body of the public chain, enjoying the rights of users and owners.

3.2 Five Mechanisms of Osasion Public Chain

3.2.1 Pass Parameters

(1)UORA

Token Symbol	UORA
Initial Liquidity	1 billion
Token Nature	Stablecoin 1UORA=1USD
Usage Scenario	Network governance tokens, maintaining the liquidity and interaction requirements of the network

(2)AUC

Token Symbol	AUC
Initial Liquidity	137436181 pieces
Token Nature	Value currency
Usage Scenario	Asset consensus target, high value-added asset anchor
Issuing Mechanism	MPOS consensus mechanism

3.2.2 Consensus Mechanism

MPOS: Multiple consensus empower single sign-on Proof of stake

Osation establishes the consistency and effectiveness of on-chain governance and economic token data traceability through the trust-free system of the MPOS consensus mechanism, and locks in value through Multiple consensus empower single sign-on Proof of stake , the coin AUC mining mechanism guarantees the security, scalability, performance efficiency, resource consumption and other key indicators under the economic model of the public chain system. It fully guarantees the decentralized development and has an efficient and consistent consensus basis for the future development of the public chain. Provide basic guarantee for sustainability.

3.2.3 Mining mechanism

(1)Mining mechanism: node activation provides the liquidity of the UORA stablecoin in the network, and its Bayesian core algorithm will be used as the firing pin design for MPOS consensus mining.The initial price of AUC is 0.1\$, and each consensus column price increases by 0.01\$. The 5000th column price is 50.09\$, and the 9999 column price is 100.08\$.

(2) Network vector distribution: The total AUC mined by a single node is distributed equally to all nodes above the same column.For example: the AUC produced by the third node in the fifth column is evenly distributed among all the nodes above the current array, that is, the 10 nodes in the first column-the fourth column).

Within 500 columns, distribute upwards and do not include this column. Starting from column

501, distribute only upwards of 250 columns. For example: 502 columns of nodes distribute upwards from 251 columns to 501 columns, within 250 columns are creation nodes, and the 250 column distribution mechanism is not limited.

(3)1000UORA distribution: 1) Consensus recommended 60% incentive; 2) Consensus incentive pool 20% precipitation; 3) AUC mining pool 20% anchor.

3.2.4 Destruction mechanism: active destruction and passive destruction aggravate AUC circulation and deflation pushes up market value

(1) The issuance mechanism of AUC is determined to be the issuance hard cap, the total amount is constant, and it is deflation in the long run.

(2) Destruction is voluntary transfer to destruction, its issuance mechanism determines that it has been generated by consensus, and the mining AUC has the endorsement of destruction of asset attributes.

(3) The interaction of assets generated inside and outside the network forms transaction wear and fee precipitation.

(4) In the early days of the Super Consensus Community, Tuncoin has obtained the governance and voice in the future value chain, and has obtained long-term stable income.

(5) Loss of wallet is passively destroyed and cannot be recovered.

(6) In the future, there will be surplus losses in secondary trading market accounts.

3.2.5 Incentive Mechanism: Consensus Gains and Stake Gains

(1) Consensus benefits (one-time contract stamp-60% incentive/invitation code-10% incentive)

$1000 \times 60\% = 600U$

$1000 \times 60\% = 600U$

$1000 \times 10\% = 100U$

(2) Stake Income

1-1000 columns/5001-6000 columns: 0.3%

1001-2000 columns/6001-7000 columns: 0.35%

2001-3000 columns/7001-8000 columns: 0.4%

3001-4000 columns/8001-9000 columns: 0.45%

4001-5000 columns/9001-9999 columns: 0.5%

3.2.6 Governance mechanism: 100 super nodes & 300 block synchronization nodes

(1) Super node: The birth of the super node in the Osation public chain is mainly based on the MPOS consensus mechanism pioneered by the AUC mainnet. Community elections are not open, and no voting mechanism is set up. As long as they are willing to bear the rights and responsibilities of ordinary nodes such as block production and packaging, transaction

verification and accounting that the Osasion public chain does not have, and at the same time pay the necessary costs for this, you can Apply for the super node of the AUC network. For super nodes, the Osasion public chain AUC mainnet mainly adopts the mode of centralized server hosting configuration and distributed management, unified standardization consideration and cost control of physical servers and cloud servers, and the F.VOB team provides technology and maintenance, and TOCC is responsible for the computer room. Construction, server leasing, management, flattening to reduce operating costs, while maintaining the consistency and stability of node operation and maintenance level is a new model.

(2)Block synchronization node: 1 AUC to build my community → wallet address voting for election → the top 300 automatically become block synchronization nodes

Rights And Interests of Block Synchronization Nodes:

- 1) The right to initiate a contract on the community chain.
- 2) Build a community to absorb the rights and interests of consensus groups.
- 3) Participate in the rights and interests of 300 block synchronization nodes to compete and develop.
- 4) Enjoy the rights of the block synchronization node to collect clothes.
- 5) Enjoy the power of on-chain governance representation and initiate proposals.

Block synchronization income: $30\% \text{ GAS fee} \times 1/300$

Super node income: $40\% \text{ GAS fee} \times 1/100$

3.3 The Eight Cores Of Osasion

3.3.1 Financial-Level Exclusive Public Chain: Osasion asset consensus public chain, a safe and efficient underlying public chain system, the kernel builds a Bayesian network body, and a dual smart contract system including the mutual embedding agreement of the Troy main network AUC and UORA stable currency .

3.3.2 Dual Smart Contracts: Under the mutual embedding agreement, the Bayes economic model creates the independence of two smart contracts and the convenience of interaction, enhances the decentralization of the network body, and ensures the compatibility of the Troy network body's dual-token asset interaction To enhance the value capture ability of the public chain.

3.3.3 Dual-Token System: UORA: initial circulation of 1 billion; total AUC (欧赛) mining pool: 137436181. In the same network, the combination of stable currency plus the original token value currency on the chain not only retains the highlight token mining method under the POW mechanism, but also innovates the algorithm of the POS mechanism on this basis, integrating fairness and value anchoring (asset Anchor consensus), value storage, financial services on the chain, etc., and at the same time iterative development, for resource consumption close to zero,

the dual currency system in the mutual embedding agreement of the economic model, mutual promotion and one-way anchoring, is a network body the healthy development of the company provides a strong guarantee.

3.3.4 Liquidity Mining: adopt the one-coin double-mining token distribution model, provide the liquidity value anchoring of the network UORA, not only obtain the equity income UORA under the POS mechanism, but also obtain the node for the free distribution of the original asset AUC on the main network chain qualifications.

3.3.5 Independent Wallet: account registration, identity import, transfer and collection and transaction interaction are simple and easy to operate.

3.3.6 MPOS Consensus Mechanism: Node generation, inspire Byzantine fault-tolerant hashing power, generate consensus body for data interaction on the chain, hit the AUC mining pool to generate array node multi-dimensional algorithm, determine the number of nodes allocated to the network body according to the algorithm, according to the node conservation average It is worth to produce a single-point node confirmation vector to stimulate the output of the network AUC mining currency.

3.3.7 Bayes : Bayesian ecology is the ecological application layer of the Osasion public chain, which is a series of sophisticated consensus networks. Its initial stage is divided into two stages. The first stage: Sponge Network sponge (cobweb) structure, the main indicators completed: Lambus progressed, technology-led transformation to community governance-led, network self-growth DNA molding, and entered the stage of free derivation development. The second stage: Lamarck Casting, completion indicators: the completion of the cobweb node closure, with the blessing of decentralized finance, the implementation of ecological start, a high degree of community autonomy to form the survival of the fittest.

3.3.8 Distributed Decentralized Governance: The distributed governance of 100 super nodes on the Osasion public chain + 300 ordinary nodes, the ecological authorization of contract proposal voting, will promote the community to enter the decentralized governance and equality stage, and promote the security, consensus, and activity of network governance. Fairness has been improved simultaneously and has become an industry benchmark.

3.4 Bayes Ecological Benefit System

3.4.1 New Node Consensus Recommendation Revenue: two one-time contract stamps, one node with a recommended consensus will get 60% (600UORA) revenue; a perpetual code, recommended consensus will get 10% revenue.

3.4.2 Staking economic model in MPOS mechanism (one coin double mining)

(1) Liquidity mining staking income (for every new node in the world, the consensus guarantee pool will increase by 200 UORA).

(2) Qualification for free mining of the native asset AUC value currency on the Troy mainnet chain.

3.4.3 Community Building Rights:

(1) Recommend a node to obtain 200U and node AUC mining rights

(2) Recommend ten nodes to earn 2000U and 10 AUC node mining rights

(3) There are 250 genesis nodes in the column, and each column activated in advance will enjoy one column of consensus mining rights

(4) Obtain the rights and interests to enter the Osasion mainnet and initiate a contract to build an ecosystem.

(5) Obtain the voting access rights of the Bayes ecological development DAPP of Osasion main network.

(6) Obtain the qualification to enter the 300 pre-selected block synchronization nodes of the Osasion mainnet.

(7) Obtain basic voting rights to participate in the governance of the Osasion ecological community in the future.

3.5 Project Related Data And Indicators

AUC数据体系

4.The Exclusive Noun Of Ossasion

4.1 Atlantis: The pilot network of the Tory main network, the 0th stage of the public chain main network, is also the first network body of the protocol layer and the development layer. It also carries the pilot network of Tory's main network application layer DAPP.

4.2 Technical Outreach Coordination Committee:The F.VOB-TOCC group established by the F.VOB team community node consensus.Full name: F.VOB-Technical Outreach Coordination Committee.Abbreviation: F.VOB-TOCC.

Business purpose: non-profit organization. As Party A, it is used to sign super nodes.Responsible for logically sorting out project information, establishing connections with market communities, coordinating resources for services, helping super nodes and ordinary nodes in the global deployment and maintenance management, business costs are paid by the Geek Alliance initial

server super node GAS fee income.

4.3 Lambus: Exclusive operation system (100 super nodes, 300 block synchronization nodes). Under construction, the concept has not yet been operated externally. The ecology and community with Bayesian DNA have entered a state of natural development. Bayesian first-stage sponge formation: The proportion of super node elections is 55%, the centralized technology architecture exits AUC, and AUC is fully decentralized.

4.4 Derived Financial Control Distributed Interactive Ecological Public Chain: MPOS is an experimental encrypted programmable data protocol that uses a fair distribution mechanism to encourage key community members to actively participate in governance. The consensus body hash is generated through the node array algorithm, and the data is interacted on the chain, thereby hitting the AUC mining pool to generate a consensus distribution mechanism, and determining nodes on the network according to the algorithm, and issuing a relative amount of Osasion mainnet value coins. There are no reservations, no pre-mining, no venture capital benefits, and only equal opportunity mining coin distribution rules to attract a wide range of people and communities with the same vision to manage the future of the protocol and token.

4.5 Bayesian System And AUC Mining Pool

4.5.1 Bayesian System: The Bayesian system is the full name of the AUC network body. It integrates probability value estimation and database collision and compound dialectical diversification of the blockchain encryption ecological economy. It is also the moat of the fortress of the AUC system. The accumulated huge amount of UORA capital will form the ballast of the AUC net body. Ensure that the asset interaction and ecological development on the network are endorsed by a natural and strong trust, and all these powers are executed by the on-chain code, and no individual or organization has the right and cannot change it.

4.5.2 Bayesian Theory: In terms of the nature of the node and the classification of the hash algorithm, it believes that the relationship between two nodes in the same array is independent of each other. That is to say, each dimension in the feature vector of an object is independent of each other, and at the same time, according to the vector value change in the process of its community evolution, combining the important indicators of different public chain forms and multi-dimensional technologies as the reference value for probability estimation, the final selection Suitable for the most scientific ecological layout and development.

4.5.3 General Term Formula Of AUC Single-Point Mining Volume:

Increasing: $a_n = 200 / (0.1 + 0.01(n-1))$ increasing \rightarrow AUC, current value = $a_n / (n-1)$ average return.

Decrease: $b_n = 200 / (0.1 + 0.01(n-1))$, the current $n = 4999$, value = $200 / (0.1 + 0.01 \times 50) = 200 / 0.51$; $n < 4999$, the income obtained by each layer value = $b_n / (n-1) = 200 / (0.1 + 0.01(n-1)) / (n-1)$.

4.5.4 Node: The consensus body in the Bayesian system, the seed of the distribution of the community network, and the object of the value currency to stimulate the distribution of the benchmark mining pool, and the distributed point-to-point consensus confirms the data packet block.

4.5.5 Consensus Pass Code (Contract Stamp): The unique chain code generated by the node. This contract stamp is the only credential to enter the Bayesian network, and it is also the common name of the Bayesian network.

4.5.6 AUC Mining Pool: The AUC mine is where the on-chain value governance token issued by the total AUC network is located. AUC is the functional governance token and the most important asset attachment target, namely the main network value token.

4.6 MPOS: Multiple consensus empower single sign-on Proof of stake: Osasion establishes the consistency and effectiveness of on-chain governance and economic token data traceability through the trust-free system of the MPOS consensus mechanism, and locks in value through Multiple consensus empower single sign-on Proof of stake , the coin AUC mining mechanism guarantees the security, scalability, performance efficiency, resource consumption and other key indicators under the economic model of the public chain system. It fully guarantees the decentralized development and has an efficient and consistent consensus basis for the future development of the public chain. Provide basic guarantee for sustainability.

4.7 MPOS (MSSO Proof Of Stake) Consensus Mechanism: The node is designed as a firing pin. Through node generation, it stimulates Byzantine fault-tolerant hashing power and generates a consensus body for data interaction on the chain. Thus, it hits the AUC mining pool to generate a multi-dimensional algorithm of array nodes, and determines the number of nodes allocated to the network according to the algorithm. According to the conservation average value of the nodes, a single-point node confirmation vector is generated, which stimulates the output of AUC coins in the network and completes a cycle.

4.8 The Only Way To Obtain AUC: mining AUC tokens through the MPOS consensus mechanism, node contract poke and pin algorithm design, fixed mining pool, no ICO, no pre-mining, no reservation, no dark pool, confirmed mining pool hard top, do When the ore body is locked, AUC cannot be obtained through technology or artificial hands.

Brief Description: There is only one way for the Osasion mainnet public chain value currency to come out, which is to activate the node. The total amount is constant and it can only be given or sold. Behind each coin is the average distribution of the upper network body of the mining pool after the real node is generated.

4.9 MPOS Consensus Mechanism Innovation: Multiple consensus empower single sign-on Proof

of stake.

4.10 Incentive Layer

激励层

4.10.1 UORA's Liquidity Mining: Provides the ecological layer and protocol layer of the Bayesian network, the vitality of the development layer and transaction liquidity. At the same time, its corresponding carrier node, its contract stamp (activation code) will also be used as the AUC mining pool. The firing pin design not only realizes the measurement of the stablecoin network, but also welcomes the staking dual-dig, dual-flow, and inter-embedded design idea, which carries the internal loop of the network ecology, and is a Bayesian ecological sponge for asset attachment. The body provides the possibility.

4.10.2 Osasion Mainnet Node Distribution: Global AUC nodes form a spontaneous and upward value ecosystem with themselves as the origin, thereby building the initial prototype of the AUC community. After the mainnet is launched, the AUC consensus community will vote and nodes through the effective address of the API interface on the chain Distributed bidding to obtain the community distribution of early super nodes and ordinary nodes.

5.Value Evaluation of Osasion Economic Model

5.1 Token Value

5.1.1 Issuance hard cap: the total amount is constant and the circulation is limited.

5.1.2 Original MPOS mechanism: fair, open, just, low latency, low consumption and low threshold.

5.1.3 Fixed deflation design.

5.1.4 Mechanism guarantee: five major mechanisms and eight core system advantages.

Liquidity mining with one coin double mining.Break the industry circle, innovate the industry design of decentralized finance, and provide a medium for network interaction through the pledge and data flow of the network stable currency UORA, but it will not provide free services.Because of its original design, by providing the liquidity of Osasion's endogenous stablecoin, it can get into the network to participate in the free distribution of the main network's native asset value currency AUC, and will also receive staking income (the income is UORA) , This is Osasion's one coin double mining.

5.1.5 Under the influence of many important factors, the deflation of its AUC mainnet value currency will inevitably exceed the difficulty of mining BTC, becoming a situation where one currency is difficult to mine and one currency is difficult to find.The internal network is locked 1000 times, the off-site OTC of external network institutions and communities, and the subsequent difficulty of mining are popular factors. The current single-node distribution of mines: 0.01379529, waiting for the era of 3 zeros after the decimal point, to witness even more that every AUC is a precious historical moment.

Osasion Seven "Zero" Distribution Map						
Zero	Number of columns	Total amount of funds listed separately	Same column unit price	Number of nodes in a single column	Total number of distribution nodes	Single node distribution of ore

Tabulation time: 1.15

Data source: Osasion wallet Troy mainnet data

5.1.6 In summary, make a minimum guarantee estimate:

Number of columns	Net body	Estimate	Event node	Number of columns	Net body	Estimate	Event node
250	2.59\$	5\$-8\$	Start of the Genesis	3000	30.09\$	60\$-90\$	

			Node Community				UORA circulation exceeds 6 billion
500	5.09\$	10\$-15\$	Over 1,000 communities worldwide	5000	50.09\$	100\$-150\$	Open AUC Exchange to vote for listing
1000	10.09\$	20\$-30\$	The underlying technology iteration of the main chain and the open ecological application	8000	80.09\$	160\$-240\$	Heavyweight partners start full coverage of financial business
2000	20.09\$	40\$-60\$	The openness of higher-level use of the public chain	9999	100.08\$	200\$-300\$	Net body data encapsulation, all AUC mining is completed

5.2 Ecological Value

The blockchain application layer encapsulates various application scenarios and cases, similar to applications on computer operating systems, portals on Internet browsers, search engines, electronic shopping malls, or apps on mobile phones. The application is deployed on the AUC public chain network, and the future programmable finance and programmable society will also be built on the application layer. Non-paradigm decentralized finance will run through the entire project ecology, build scenarios for the multi-party use of consensus assets, and provide basic services for users' future asset on-chain, blockchain inclusive finance, and loan mortgages. The significance at this moment has three meanings: (1) The holding address exceeds 25 million; (2) AUC is fully circulated; (3) AUC anchors multiple assets. The ecology will grow with the flow and come for the flow.

5.3 User Value

The users of Osasion are not only nodes, but also the blockchain industry audiences who demand decentralized financial services outside the network. The entire network users, regardless of order, are all network nodes. Therefore, not only the total number of mining pools will be constant, but the number of nodes will also be constant at 25 million, but the coin-holding

addresses will be much more than 25 million due to the brand effect, asset interaction, and chain-linking requirements, and other public chains. At this time, based on market value valuation, the market value of AUC will exceed \$15 billion. However, according to the valuation of the project with the same traffic, the market value is underestimated. Even if the market value of the network is guaranteed, the project will rank among the top 20 in the world, but the value here highlights that it is derived from users, that is, 25 million currency holding addresses, and it is also a strong resource. The reason for the flood of integration and high-quality applications.

5.4 Industry Value

The innovative token distribution mechanism pays tribute to BTC, but it also eliminates various common problems caused by POW, and integrates the barriers of blockchain technology and the integration of encrypted assets. Its core development path: taking consensus users as the core, building node communities as the essence, relying on equal rights of assets, starting from the user's perspective, taking the master consciousness as education, and the final result orientation are the industry's most anticipated. The flow is king, the flow is determined, the goal is clear, the 9999 node evangelism is achieved, and the AUC must be in the top 20 mainstream.

6. Some Questions and Answers About Osasion

A: How to become a node miner of Osasion?

M: Two conditions, 1000 UORA net assets and a contract activation code.

A: How to participate in the liquidity mining of Osasion public chain?

M: Successfully activating a node will provide the asset liquidity of the network body 1000UORA and become a node miner of the Osasion mainnet, thereby obtaining the liquidity mining income of UORA and AUC tokens.

A: How is the 1000 UORA that enters the Bayesian network distributed?

M: 1000UORA that enters the network is a stable currency that is one of the original assets on the Osasion chain: UORA (Aura), activating the node, is equivalent to providing the basis for the issuance of asset endorsement for the main network stable currency 1000UORA, thereby providing the network Liquidity, 60% of UORA will continue to flow within the network consensus

incentives. 200 UORA enters the consensus incentive pool to complete the Stake liquidity incentive cycle, and 200 UORA enters the AUC mining pool to become the endorsement of the destruction end asset.

A: What is the internal circulation of consensus incentives?

M: Consensus incentives are rewards generated by consensus recommendation nodes, which are obtained by recommender nodes, but in essence, the issuance of UORA corresponds to USDT corresponding to legal currency. In principle, every UORA has asset attributes, so recommenders receive 60% of the reward 600 UORA , It is also the asset that has completed the asset endorsement and entered the network body. Whether this 600UORA is used to activate the node or is traded through OTC or secondary market currency, 600UORA will still return to the Osasion network body, but it may go more in the future The trading account under the scene. For example: lending, other asset trading media, etc. The essence of this entire transaction link is to provide usage scenarios for Osasion' s stable currency UORA, and to provide liquidity requirements for monetary assets. This is UORA' s economic model for Osasion. And the internal circulation provided by the future public chain ecology.
